Code written

```c
#include <stdio.h>

int main() {
int t;
if (scanf("%d", &t) != 1) return 0;
while (t--) {
long long n;
scanf("%lld", &n);
// Get the last digit
int last_digit = n % 10;
// Get the first digit by dividing until single digit remains
int first_digit = n;
while (first_digit >= 10) {
first_digit /= 10;
}
// Print the sum of first and last digits
printf("%d\n", first_digit + last_digit);
}
return 0;
}
```

Problem

Danial likes to separate out the digits of a number and play with them. This time he wants you to help him with a problem. Given an integer **N**, he would like you to find the sum of the **first and last** digits of **N.**

INPUT: The first line of the input contains a single integer **T** , denoting the number of test cases. Each of the next **T** lines contains a single integer **N**.

OUTPUT: Each line of the output contains a single integer **S** denoting the sum of the first and last digits of **N.**

CONSTRAINTS:

$0<N<=10^6$

$0<T<=100$

Sample Input	Sample Output
3 1234 124894 242323	5 5 5

Time Limit: 1

Memory Limit: 256

Source Limit:

```c
#include <stdio.h>

int main() {
    int t;
    if (scanf("%d", &t) != 1) return 0;

    while (t--) {
        long long n;
        scanf("%lld", &n);

        // Get the last digit
        int last_digit = n % 10;

        // Get the first digit by dividing until single digit remains
        int first_digit = n;
        while (first_digit >= 10) {
            first_digit /= 10;
        }

        // Print the sum of first and last digits
        printf("%d\n", first_digit + last_digit);
    }
```
