Code written

```c
#include <stdio.h>
#include <stdbool.h>

int main() {
int n;
if (scanf("%d", &n) != 1) return 0;
bool is_prime = true;
// Numbers less than or equal to 1 are not prime
if (n <= 1) {
is_prime = false;
} else {
for (int j = 2; j * j <= n; j++) {
if (n % j == 0) {
is_prime = false;
break;
}
}
}
if (is_prime) {
printf("1\n");
} else {
printf("0\n");
}
return 0;
}
```

Problem

Given a number n, tell if it is a prime number. Print 1 if it is a prime number and print 0 if the given number is not prime.

Input :

A single integer n.

Output :

1, if the number is prime.
0, if the number is not prime.
Print a \n after the answer.

Constraints :

2<=n<=100

Sample Input	Sample Output
5	1

Time Limit: 1
Memory Limit: 256
Source Limit:

Explanation

Since 5 is a prime number, the output is 1.

```c
    if (n <= 1) {
        is_prime = false;
    } else {

  for (int j = 2; j * j <= n; j++) {
     if (n % j == 0) {
       is_prime = false;
         break;
      }
}
}

    if (is_prime) {
        printf("1\n");
    } else {
        printf("0\n");
    }

    return 0;
}
```
